

Officer Report

4 February 2025

There are two large wounds on the main stem with exposed hardwood showing the early signs of decay. There are fruiting bodies of decay organism fungus ganoderma, that are present in two places on the main stem.

The condition of the tree is such that it has a reduced safe useful life expectancy and consequently it is not viable in the long-term.

The proposal to fell the tree is reasonable and necessary on safety grounds.

Decision - Approval

Note: TPO to be amended to reflect the removal of the tree.
